

Phishing Awareness Guide (Summary)

1. What is Phishing?

Phishing is a social engineering attack used to steal login credentials or sensitive data by pretending to be a trusted service.

2. Common Signs of Phishing

- Suspicious sender address
- Urgent or threatening language
- Unexpected login requests
- Mismatched URLs
- Attachments from unknown sources

3. How to Protect Yourself

- Always check the full URL before entering credentials.
- Enable two-factor authentication (2FA).
- Avoid clicking links in unsolicited emails.
- Hover over links to preview the real destination.
- Verify with official channels if unsure.

4. What To Do If You Get Phished

- Immediately change your password.
- Check if the same password is reused elsewhere.
- Enable 2FA.
- Inform your security team or instructor.

5. How Our Simulator Helps

This guide accompanies the Safe Dark Web Risk Simulator. After falling for a simulated phishing page, review these steps to learn how to identify and avoid real phishing attempts.
